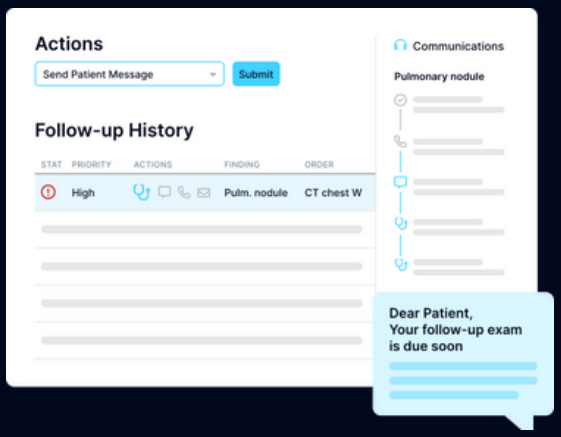
Rad AI Continuity Overview

AI-Automated Patient Follow-up

The Challenge

About 12% of all radiology reports have follow-up recommendations, yet only about 30% of these patients receive appropriate follow-up care.

Millions of cancers, aneurysms, etc., go untreated and unmanaged, creating a significant delay in patient care, contributing to poor prognosis, and presenting a concern for overall patient health and safety.



The Solution: Rad AI Continuity

Rad AI Continuity is the most comprehensive, automated patient follow-up solution for radiology.

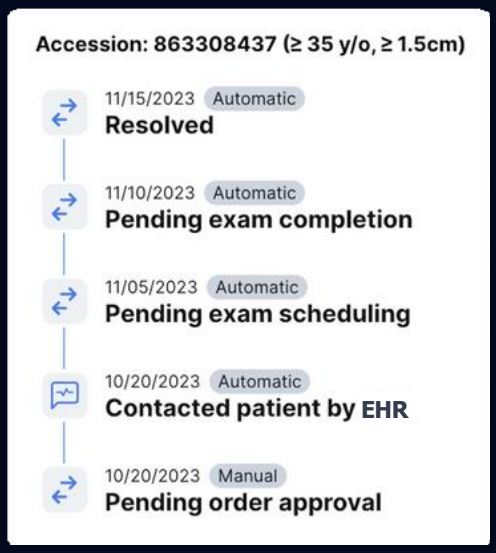
It tracks over 50 categories of findings and 250+ sub-categories, populates a highly automated follow-up worklist, and drives automated communications, reminders, and status updates with ordering physicians and patients.

Substantial, Proven ROI

Rad AI Continuity is pivotal in enhancing operational efficiency and elevating patient care.

Our partners have experienced:

- **2x** the typical rate of patient **follow-up.**
- A **net positive ROI** within the first 12 months of use.
- A **system-wide patient safety net**, mitigating medical liability and reducing patient leakage to competing hospitals and health systems.
- **100+ probable cancers** caught annually due to increased follow-up adherence.



Cloud Deployment

- Minimal IT footprint with no on-premise servers, VMs, databases, or local clients required.
- SOC 2 Type II HIPAA+ certification for security, confidentiality, and availability.
- Depending on the organization's IT availability, installation typically requires 2-6 months.

Rad AI Continuity Overview

How Does Our AI Improve Patient Follow-Up?

Two Key Areas: Automated Detection + Communication

Intelligent Detection

- **Detect the finding** - use an AI model trained on ½ billion reports
- **Classify the finding** - use natural language processing to identify category and anatomy
- **Set follow-up date** - based on radiologist's recommended timeframe and consensus category
- **Manage in one place** - central dashboard for visibility and tracking

Seamless Communication

- **Live status updates** - HL7 triggers (order, scheduled, etc.)
- **Contact the patient** - automatically via SMS, direct mail, and EHR messaging
- **Contact the provider** - automatically via EHR messaging or fax
- **Track the program & progress** - comprehensive audit trail

EHR Integration

Continuity's communication engine can trigger various EHR communications, depending on the EHR integration. For example, Continuity can trigger Epic MyChart messages via Epic's Actionable Findings module.

NOTE: Rad AI collaborates with your EHR/RIS vendor to provide the most comprehensive integration possible. However, some vendors may not support advanced features like those in levels 2 and 3 below.

Level 1

Standards-based HL7 v2 integration

- Ingests & automatically updates status for reports, orders, and ADT

ORACLE Cerner, Epic, MEDITECH, FUJIFILM Value from Innovation, athenahealth, Allscripts

Level 2

Includes Level 1, plus

- Provider messaging via EHR inbox*
- Context synchronization with patient chart*

ORACLE Cerner, Epic

Level 3

Includes Level 1 & 2, plus

- Patient messaging via patient portal
- Automatic order placement* One-click approve/decline for pending orders*

Epic
